Research Institute for Humanity and Nature

Japan–Philippine Urgent Collaborative Projects
regarding “Typhoon Yolanda” within the J–RAPID Program

Background

Coastal area ecosystem services are indispensable for rural people, but are also easily damaged by many things including natural disasters. Many coastal areas with high biodiversity and biological productivity are located in tropical zones, as is the case in Southeast Asia. In such areas, ecosystem services, local livelihood and culture are closely related. Therefore, relationships among life, culture, local ecosystem should be deeply taken into account for establishment of disaster-prevention measures, especially in rural.

Aims of this project

This project aims to evaluate the super typhoon impacts on both ecosystem and livelihoods in coastal zone. Collaborative field surveys for evaluation of ecosystem impacts will be conducted by Philippines and Japanese researchers.

This collaborative research could provide us a good practice for disaster prevention research under global climate change.

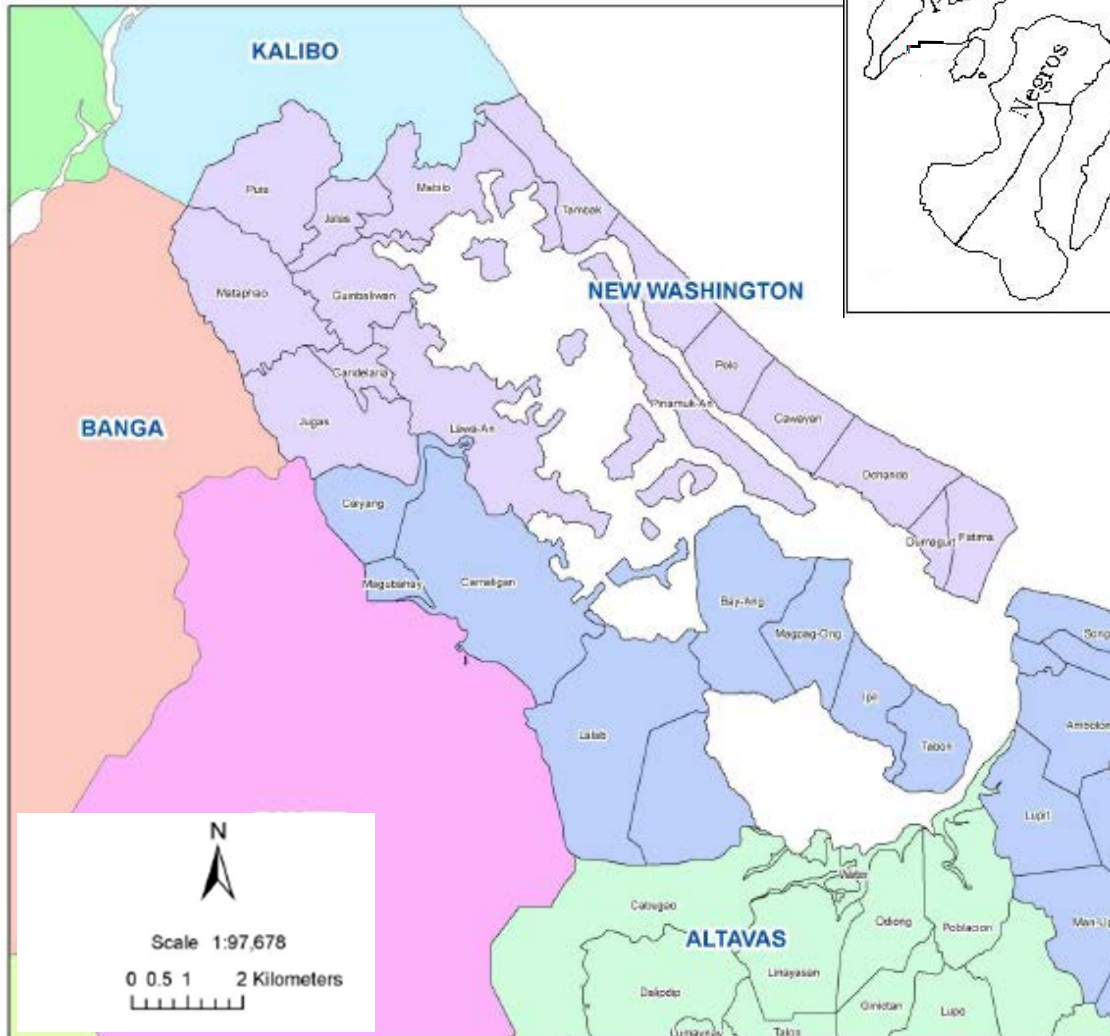

Project Framework

We surveyed Impacts on following items;

1. fishery including damages of fishing gears and fish catch were evaluated based on field survey at sites,
2. aquatic resources were evaluated based on environmental data and survival rate of small shrimp in aquaculture ponds.
3. Mangrove forest was evaluated through Satellite image analysis.
4. Livelihoods of small scale fishers based on the interview and observation surveys.

Batan Bay, Philippines

- Batan Bay is an important water body
- Mangroves are found around the bay making it a very good breeding and nursery ground of different aquatic organisms
- The fishery of the bay provides livelihood among coastal community dwellers

The Fisheries of Batan Bay

Fishing gears	No. of units
Mod. fish corral/lift net	1,235
Fish corral	769
Filter net	185
Lift net	276
Crab lift net	1,820
Pots (all types)	9,749
Bottom set gillnet	172
Drift gillnet	19
Barrier net	60
Line fishing (all types)	226
Others	

The Fisheries of Batan Bay

The Fisheries of Batan Bay

Fishponds

Oyster culture

Fish cages

INFORMATION as of
6:00 PM, Nov 9, 2013

SUPER TYPHOON YOLANDA

Super Typhoon "Yolanda" (Haiyan) entered PAR

"Yolanda" left PAR Saturday afternoon

State of Calamity declared in at least 6 areas

At least 138 reported dead, 14 injured and 4 still missing

At least 4,282,636 persons or 944,597 families affected in 36 provinces

P6,454,769 cost of damages to agriculture and infrastructure

28 areas experiencing power outages

11 provinces without stable communication lines

Completely damaged	437	153	674	108	26	231	36	0	1665	62.1
% Damaged	100	100	90.5	97.8	100	98.9	73.4	0	93.2	

Typhoon Haiyan Impacts on Capture Fisheries

Fishing gears	Resumption of fishing
Mod. fish corral/lift net	From day 9
Fish corral	From day 9
Filter net	From day 21
Lift net	From day 21
Crab lift net	From day 21
Pots (all types)	From day 21
Gillnet	From day 7
Line fishing (all types)	From day 9

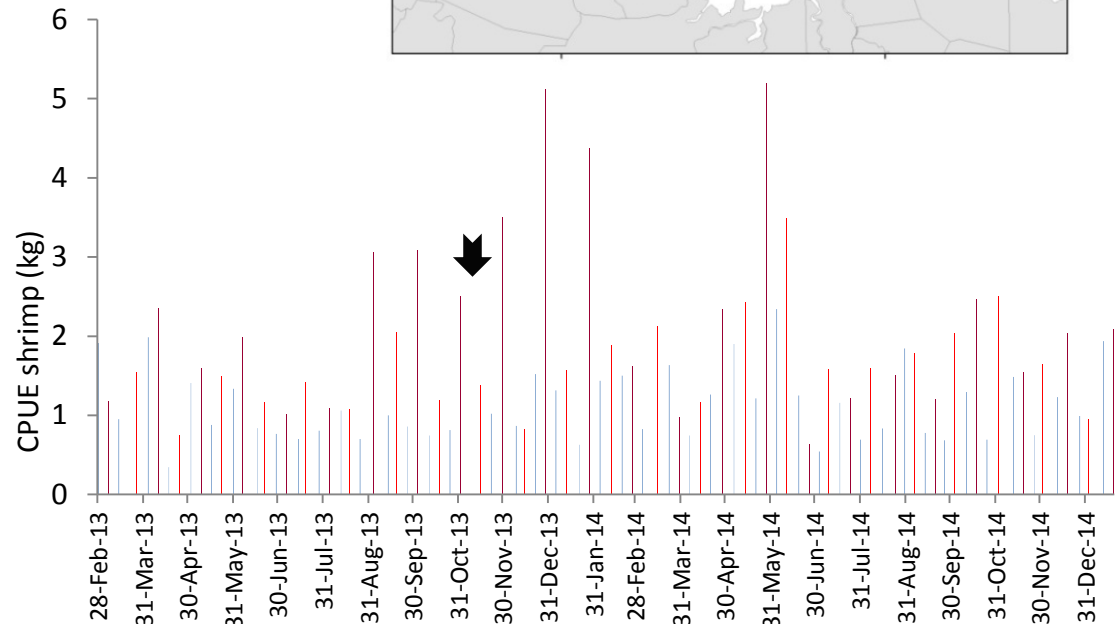

Typhoon Haiyan Impacts on Capture Fisheries

- Materials
- Supply
- Cost
- Labor

Typhoon impacts on Modified Fish Corral/Lift Net

Typhoon impacts on Fish Corral

CPUE (kg/operation)

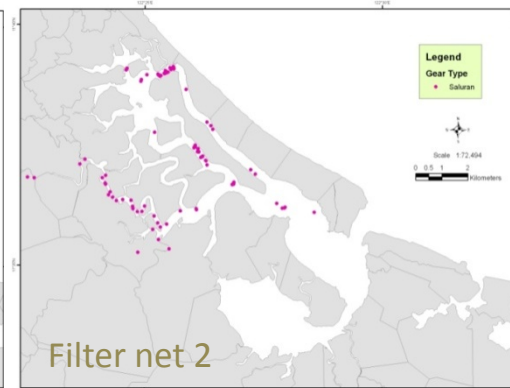

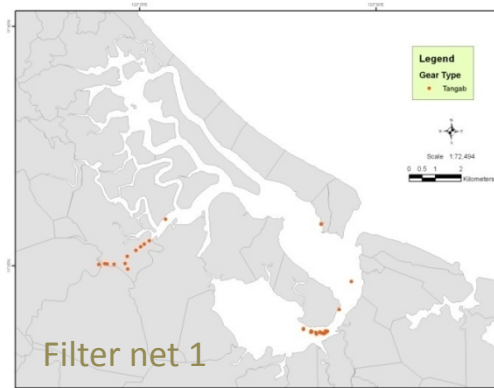

Milkfish *Chanos chanos*

CPUE (kg/operation) less milkfish

Typhoon impacts on Filter Net

Typhoon impacts on Lift Net

Typhoon impacts on Pots and Gillnet

- Lack of bait materials
- Drift gillnets to set gillnets

Government support

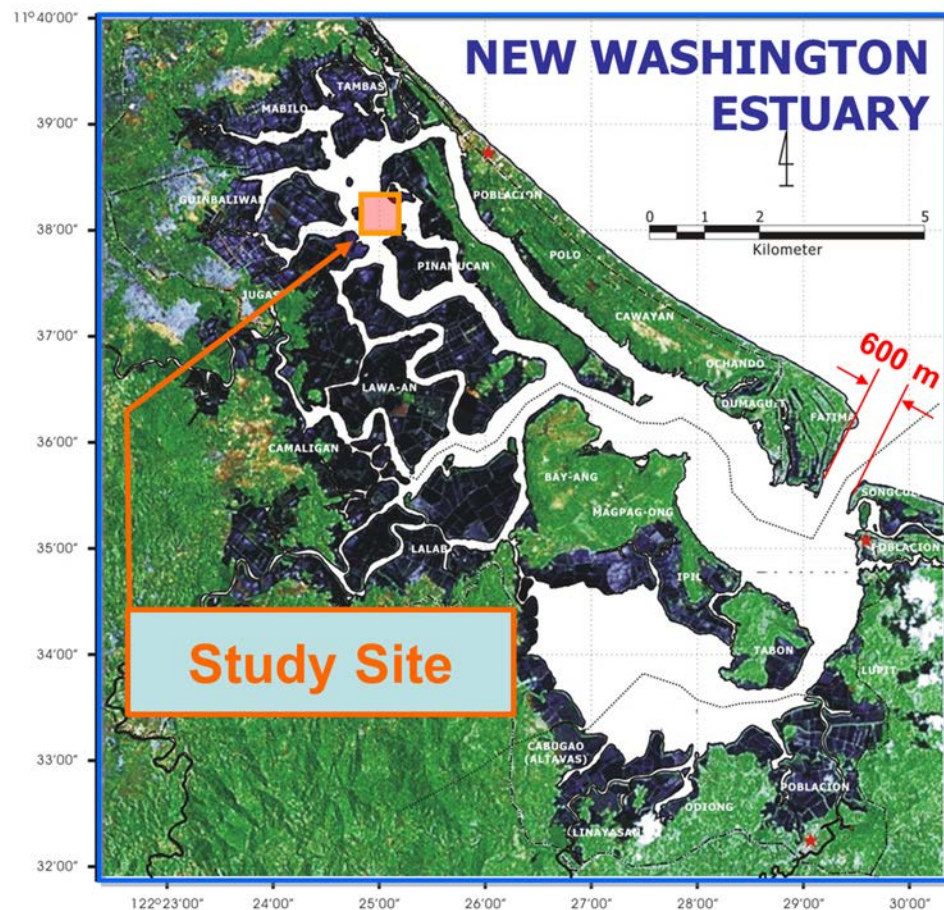

1. Work for cash (mangrove planting)
2. Oyster culture support
3. Net
4. Boat

Summary

1. Stationary fishing gears in Batan Bay are highly vulnerable to extreme weather events such as super typhoons
 - 1.1 Pre-Yolanda: 2,680 stationary gears
Post-Yolanda: >93% damaged (partial and complete)
 - 1.2 Among the gears left:
Not damaged: 17.8%
Partially damaged: 82.2%
2. Resilience is influenced by several factors:
 - Availability of construction materials
 - Connectivity of fishing operations in Batan Bay
3. Adaptation in some gears.
4. Government role
 - Institutional support
 - Opportunity for management reforms
5. With the lessons from the Batan Bay cases, the November 2013 super typhoon offers opportunity of understanding the vulnerability of similarly-situated tropical coastal environments with high probabilities of extreme weather events.

Impacts on tiger prawn resources

Impacts on shrimp growth and mortality rate

Heavy rain by “Yolanda” derive low salinity in the coastal habitats.

Results: Survival of shrimps

Low salinity put stress on shrimp

Results: Growth of shrimps

Growth rates were also deteriorated after Typhoon.

Typhoon and heavy rain cause bad impacts both on growth and survival rate of shrimps

Impacts on mangroves

Development of impact assessment method through satellite image analysis.

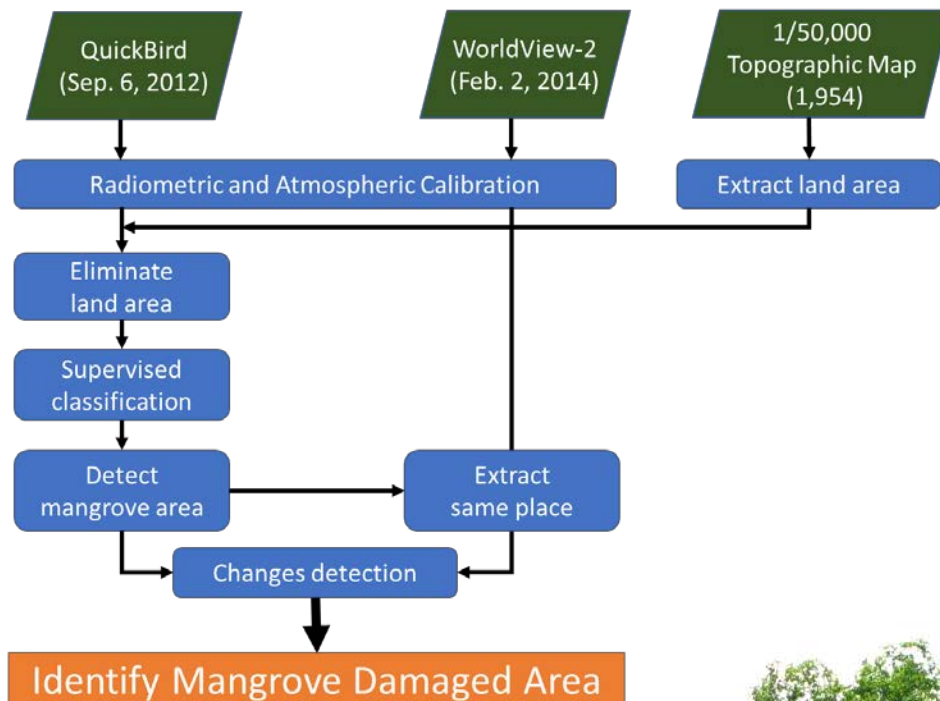

Image comparison completely same place between pre and post
Typhoon Yolanda

Damaged area could be identified.

Spatial distribution of damaged mangrove blocks.

Characteristics of spatial distribution of damaged mangrove blocks.

- Total damaged area was 80 ha of total mangrove area (429 ha)
- Minimum maximum and average block size of damaged area was 5 m², 20,217m² (2 ha) and 68.4 m² respectively.
- Small size of damaged mangrove blocks were scattering in whole research area.
- North faced mangrove trees were strongly damaged.

Conclusion

- ◆ We succeeded to develop urgent mangrove damage evaluation method by using two temporal high resolution remote sensing images.
- ◆ We could recognized the spatial characteristics of mangrove degradation.
- ◆ Fortunately, we have captured image of this area before Yolanda hit. We could not analyze if we didn't order this image to the satellite image distributor, before disaster. In fact, we could not find any good images in some places before Yolanda. This situation suggests that frequently or annual monitoring by remote sensing is needed for places where are affected by disaster frequently for preparing to future disaster and monitoring system.

Impacts on livelihoods

Impacts on livelihoods

Strong wind destroyed many building structure and trees.

Was your house flooded during Typhoon Yolanda?	Yes	1	82
	No	2	356
How would you describe the extent of damage? <i>Paano mo mahambae do kabahoeon it nasamad?</i>	No damage	1	23
	Partially Damaged	2	201
	Totally Damaged	3	215
What mainly caused the damage?	Flood	1	4
	Strong wind	2	346
	Combination of flood and strong wind	3	30
	Trees felling	4	93
	Other specify	5	1

Heavy rain affected on coastal fishery resources and ecosystems, though.

Disaster management and Preventions

2012 by JG Suyo

Preparation is important to reduce damages from Typhoon.

1. Household surveys
2. Key informant interviews

Qution	Answer	No.HH
Did you prepare for the coming of Typhoon Yolanda?	Yes	413 (94 %)
<i>Nagpreparar ka baea sa pag-abot it bagyong Yolanda?</i>	No	26 (6 %)

Many Families treat their Houses and trees.

Tied the house to a tree; 212HH (48.3%)

Put weights on the roof ; 153HH (34.9%)

Disaster management and Preventions

Questions	Answer	No.
When was the first time you heard about Typhoon Yolanda?	Never heard before it hit	5
<i>Kan-o mo una nabatian ro parte sa bagyong Yolanda?</i>	One week to two days	402
	One day	32
What was the first information you heard about Typhoon Yolanda?	It is a Supertyphoon	425
<i>Anong klaseng impormasyon ro imong unang habatian parte sa bagyong Yolanda?</i>	Will destroy all along its path	43
<i>Multiple answer allowed</i>	Need for evacuation of families in the coastal areas	107
	It will bring high storm surge	2
	Others	6
Where did the information come from?	Barangay Officials	148
<i>Siin naghalin do impormasyon?</i>	Neighbor	79
	Radio	264
	TV	358
	Newspaper	6
	Others , Specify	13

Many residents got information from TV and Radio,
But **necessary of evacuation was not highlighted.**

Disaster management and Preventions

Disaster management strategies	n (%)
Preparedness/response mechanisms*	
Prepared food	70 (37)
Strengthened house structure	35 (19)
Evacuated/relocated	35 (19)
Secured belongings	27 (14)
Others (prayed, trimmed trees)	15 (8)
None	5 (3)
Coping mechanisms (Top 3 responses)*	
Engaged in other income source/s	43 (38)
Relied on external assistance	32 (28)
Loaned money	20 (18)

Note: * Multiple response items

Prepared FOOD is most important.

Role of coastal fishery

- After 2 days from Yolanda Passed, fish market was sold fish and shrimps.
- This small scale fishery provided food and incomes to local residences.

Coastal ecosystem and small scale fishery have important roles as safety net for rural area.

This fact should be taken into account for disaster management.

(Photos, 8:29am, 9th Nov. 2013)

Information supply and food security Including fishery adaptation are quite important.

Thank you!
